this book covers design propulsion and a history of motor boats and includes manufacturers details of boats ranging from the smallest inflatables to the vast superyachts of the rich and famous

this book provides a comprehensive guide for the analysis and design of anchor systems used for mooring

offshore floating structures much of the experience is based on applications toward the offshore oil and gas industry but the substantial potential for offshore renewable energy systems is addressed the major types of anchors are described with respect to their basic design concept advantages and limitations appropriate framework for analysis and observed performance this book addresses all aspects of anchor behaviour related to anchor design including the installation performance load capacity deformation and structural integrity of the anchor itself coverage is also provided of appurtenant components of anchor systems in particular of anchor line chain mechanics in the soil and water columns much of the material presented represents relatively new developments including several new anchors which have been developed within the last decade so the book will provide a useful compendium of information is largely scattered in journals and conference proceedings this book is intended for engineers engaged in offshore geotechnics and marine engineers involved in mooring system and floating structure design while the analytical methods presented in this text have a strong theoretical basis the emphasis is on simplified computational formats accessible to design engineers

early stage protein misfolding and amyloid aggregation volume 329 the latest in the international review of cell and molecular biology series presents comprehensive reviews and current advances in cell and molecular biology including articles that address the structure and control of gene expression nucleocytoplasmic interactions control of cell development and differentiation and cell transformation and growth the series has a worldwide readership and maintains a high standard by publishing invited articles on important and timely topics as authored by prominent cell and molecular biologists provides comprehensive reviews and current advances presents a wide range of perspectives on specific subjects includes valuable reference material for advanced undergraduates graduate students and professional scientists

the thermomechanical properties of composites on polymer matrix at high temperatures are essentially different from those at normal temperatures the main distinctions briefly consist in the following at high temperatures there occurs an irreversible variation degradation of all mechanical and thermal properties of a material that usually has a complex non linear character depending on time exposure under high temperature there are complicated internal physico chemical processes in a matrix and fibres under high temperatures called by the general notion of ablation the internal physico chemical and mechanical processes run differently in the matrix and fibres and this leads to the appearance of considerable internal thermal stresses generally speaking a

composite under high temperatures can be considered as a multiphase system consisting of solid gaseous and fluid phases interacting mechanically and chemically with each other there are three levels of temperature normal elevated and high normal or room temperatures are 10 30 c elevated temperatures are 30 200 c high temperatures are those above 200 c however the dividing line between elevated and high temperatures depends on the material involved a temperature is called high for a particular composite material if at this temperature irreversible internal physico chemical transformations occur in the matrix and or fibres of the material
